The Implementation Commission for European Standards within Geotechnical Engineering, 2.0 (IEG 2.0)

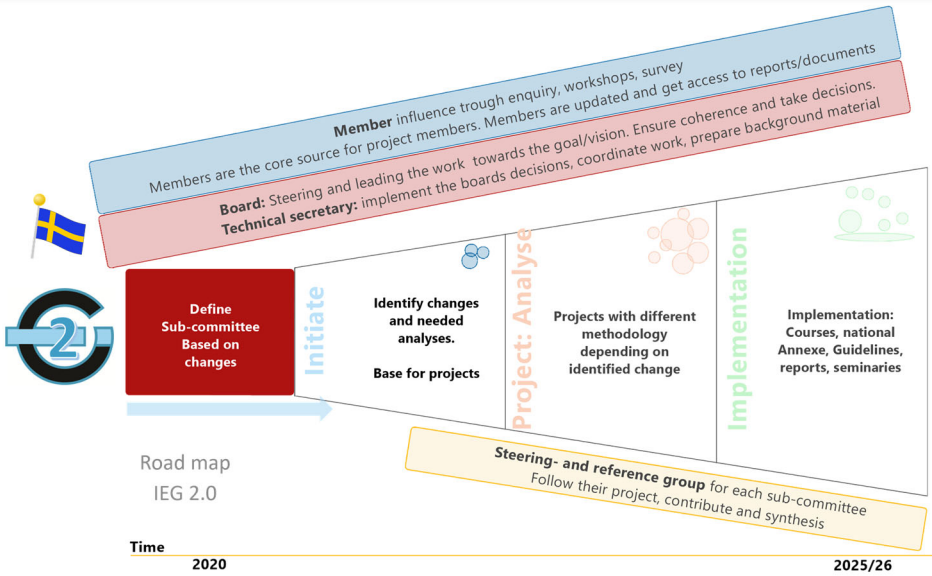

National implementation commission for Eurocode 7 for joint development of geotechnical engineering practice.

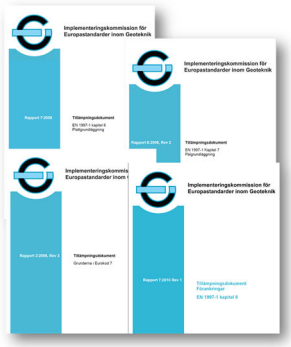

The **Swedish national initiative** to utilise the 2nd generation of Eurocode 7 to **create a platform for development** of the geotechnical engineering practice within the Swedish building and civil engineering sector.

The objective of the Swedish national implementation commission is to use the revision of Eurocode 7 to facilitate a national joint development of geotechnical engineering practice. We hope the paper might inspire others to take similar initiatives when new design codes and standards are to be introduced. The paper covers how stakeholders from all parts of the Swedish geotechnical construction industry established the implementation commission IEG 2.0 as a non-profit organization and how obstacles are solved. This includes financing and establishing an efficient work process to analyse the many upcoming changes to the Eurocode clauses. This in fact being the second Swedish implementation commission for Eurocode 7, the paper concludes that this procedure of working together in the industry is a great success, facilitating an increased competence among Swedish geotechnical engineers and therefore also increased competitiveness of the Swedish geotechnical construction industry.
